

Where is data stored?

RANGE OF STORAGE

Where is data stored?

Data can be stored on a range of devices.

Different data is stored on different backing storage devices depending on what that data is and how it is used.

Hard drives, USB flash drives, SIM cards, mobile phones, tablet computers... are just some of the more common methods of storing data.

Cloud Storage

- More and more data today is being stored on the 'Cloud.'
- The Cloud is the name given to a range of services like Dropbox, iCloud and OneDrive, to name but a few, that allow users to upload data over the internet and store it all on a company's servers.
- The data that is stored online will probably be stored in large data centres.
- Many companies all over the world will hold data about you, your friends and family.

Now, onto some tasks
